

Everything you need to make charts, diagrams and infographics in Prism

Charts, diagrams, flowcharts and cards rendered from accepted inputs; AI infographics, frameworks and decision pages from your material; and campaign kits for supported channels. Review your source, the output and its intended use before publishing.

What Prism is

Prism makes business visuals in two different ways, and it helps to know which one you're using.

Drawn from what you type

The Chart, Diagram, Flowchart and Card makers render accepted structured labels and values under the selected shape and display settings. There's no AI involved, and making and previewing a visual is free, with or without an account.

NO AI

Written with AI

For infographics and frameworks, AI drafts content and composes an image from your brief and sources. Retained source fields can be edited and recomposed, but the image is not a native chart workbook or a set of individually editable drawn objects. Check words, figures, layout and source context before publishing.

USES PLAN CAPACITY

Campaign kits are the third part of Prism: one message turned into a picture cut to the exact size of each place you post it, with your headline laid over it, and a caption and alt text for each channel.

Your Prism dashboard

Start with **New visual** at the top of the dashboard. It lists *Infographic, Chart, Diagram or flow, Campaign kit, Framework or decision* and, when Print is available, *Print*, then *Card, Document to visual, Combine visuals* and *Open a Mermaid or Prism file*. Until you have made something, the dashboard shows the same choices as picture tiles under **Make your first visual**, with links to try the chart, diagram and flowchart makers on sample data; a *Create a visual* link elsewhere in Gixo opens them too, under **Make something**. On the tiles, *Diagram or flow* also links to *Flowchart instead* and *Framework or decision* to *Decision page instead*, and **More** holds the extra choices, adding *Live data and batches* once you have a saved chart. **Brand**, beside New visual, opens the brand settings you share with your other Gixo products, so changes there apply across the workspace.

Open your Prism dashboard gixo.ai/dashboard/prism →

Your work brings everything you make in Prism into one grid, most recently updated first:

- Once you have some work, filter by *All work, Infographics, Charts and diagrams, Campaign kits, Frameworks and decisions* or, when Print is available, *Print designs*, and use *Search your Prism work* to find a recent or older item. Infographics, frameworks and decision pages can also carry labels, with a filter of their own.
- Each card has a ⋮ menu with what that kind of work supports: a download (PNG or SVG for a saved visual, ZIP for a kit, PDF for a print design), *Copy private link*, which works only for people who can already open the item, *Rename, Duplicate* and *Labels...* for infographics, frameworks and decision pages, and *Delete*. **Select** lets you tick several visuals and delete them together; campaign kits and print designs are deleted one at a time from their menu.
- **Deleted items** lists deleted charts, diagrams, cards and combined visuals, and deleted infographics, frameworks and decision pages, newest first. *Restore* brings any of them back; the owner of a saved chart or diagram can also *Delete forever*. **Older single pictures**, when present, sits below the grid and keeps the single images made before campaign kits apart from them.

The current Prism dashboard: Make something tiles and Your work filters. Captured 13 October 2026 in a local workspace with fictional samples.

gixo.ai/dashboard/prism

The actual More disclosure, captured locally on 13 October 2026. Opening these navigation choices does not create or generate work.

Find saved work using the type filter and search; each card has its own actions menu. These are existing fictional local samples.

Making an infographic

An infographic starts from a brief and, if you like, your own material. It takes three steps on one page, and only the last one uses plan capacity.

[Create Infographic](https://gixo.ai/infographics/create) gixo.ai/infographics/create →

1. What is it about?

Answer *What should this infographic explain?* That's enough to continue. To work from your own material, click **Add a file or existing content**, then **Upload files** (up to 10 files: PDF, Word, text, CSV, Excel or images, 500 MB each and 2 GB in total), **Paste text**, with an optional title, or **From your library** to pick a document already in Gixo. There's no field for a web address, so paste the page's text instead.

2. Pick a layout

Choose a **Shape**, a **Layout** and a **Style**. The layouts are pictures, up to nine of them, such as a statistical snapshot, comparison, process, timeline, chart, list or quote. Once there's a brief or a source, one is marked *Suggested*; the suggestion follows what you type and uses no plan capacity. The Chart layout is offered only when your content has numbers or a table.

SETTING	CHOICES
Shape	Social post 4:5 · Square post 1:1 · Slide 16:9 · Story 9:16 · Report, long page. Until you pick one, the layout's own shape is used.
Style	Ten sample tiles: Executive consulting · Modern SaaS (the default) · Editorial report · Startup pitch · Data journalism · Minimal monochrome · Bold social media · Education / explainer · Corporate presentation · Premium magazine
Language More options	English unless you choose another. For another language, Gixo writes the infographic in English, then translates its text.
Audience More options	Who it's for, in your own words. Leave it blank and Prism writes for a general professional audience.
Detail level More options	Quick · Balanced (the default) · Detailed

3. Make it

Everything optional sits under **More options**: the language, audience and detail level, and your colours. A line above the button sums up the shape, layout, style and language. Click **Generate Infographic**; with nothing entered yet, it points you back to the text box instead. It uses plan capacity and usually takes 1–2 minutes. You can leave the page: the infographic appears in Your work when it's ready, and if you stay, its viewer opens.

Under More options, tick **Use custom brand colors** to set accent, text and background colours for this infographic, or choose *Use saved Brand Kit colors*. Manual colours do not change your saved Brand Kit; loading saved-kit colours needs Professional or higher access. Check the palette preview: readable-text contrast may adjust your choice. Recheck the required export. The current composed HTML download embeds the rebuilt image rather than exposing its retained source as editable objects.

The recommended plan and layout cards after *Analyze Content & Find Best Layouts* .

In the infographic viewer

- **Regenerate (1×)** makes one alternative with the same style and layout rules. Each infographic gets one, and it uses plan capacity like a new infographic.
- There is no separate step to mark a version as final: the infographic is saved and stays in the viewer.
- **Download** offers *Export HTML*, *Download PNG* for the owner, *Export Feed PNG* (4:5, 1080 × 1350), *Export Story PNG* (9:16, 1080 × 1920) and an *Export Feed + Story ZIP*. Infographics download as PNG and HTML, with no watermark.

- **Edit visual** appears where retained editable source fields are available. Where offered, compare *Original* with a supported designed style under *Style*, inspect its preview and choose **Update visual** to apply it. Styling changes presentation without a new image-model call; it does not unlock arbitrary objects or recalculate decision scores. Revise supported text on the *Edit* tab or set accent, text and background colours on the *Style* tab, then click **Update visual**. This rebuilds the PNG without a new image-model call and keeps the generated geometry locked. If the preview fails to rebuild, edits can be saved while the old preview remains; retry before using it. Inspect the wording, figures and layout after updating.
- **Logo** adds one corner logo from an image address, or your saved logo on Professional and up, in any of the four corners.
- **Image position and size** lets you move, resize, rotate, flip or fade the image, then **Save visual**.
- **Show sources**, under *More* below the viewer, lists the material the infographic was made from.
- **Share** is one button for the public link and its embed code. It creates a public link on any plan including the trial, or shares the infographic with named people from Professional up. People you share with as *View only* can see it but can't download it.

READ IT THROUGH BEFORE YOU PUBLISH

Inspect names, numbers and claims against your sources. AI-generated image details can differ from retained source fields. For structured numeric charts, use Chart Maker and review the accepted table, display settings and actual export.

The infographic viewer, with *Edit visual* beside the preview.

Building a framework

A framework is a one-page thinking tool, such as a 2×2 matrix, a funnel, a flywheel or a maturity model. AI writes it from your material and Prism draws it. It takes the same three steps on one page as an infographic.

Create Framework gixo.ai/frameworks/create →

1 What is it about?

Answer *What should the framework show?* in a few words, up to 100 characters. It becomes the framework's title. For the detail, click **Add a file or existing content**, then *Upload files* (the same limits as infographics), *Paste text* or *From your library*.

2 Pick a layout

Pick one of 14 framework layouts, which you can search: 2×2 Matrix, 3×3 Matrix, Pillar Model, Funnel, Flywheel, Layered Stack, Value Chain, Capability Map, Maturity Model, Venn Diagram, Concentric Circles, Hierarchy Tree, Balance Scale and Pyramid. Every framework is made as a wide 16:9 image. For exact boxes and arrows you type yourself, the page links to the Diagram maker.

3 Make it

Under **More options**, *How closely to follow the layout* is automatic unless you choose: exactly, as a named framework such as SWOT; the same shape for every part, for comparing; balanced; or loosely, where parts can differ in size. Automatic means exactly when your title names a known framework, and balanced otherwise. Custom brand colours are here too. Then click **Generate Framework**. It uses plan capacity, and the framework's page opens straight away and shows it when it's ready, so you can leave.

The framework viewer has *Download* (*Export HTML*, and *Export PNG* for the owner), *Share*, *Version history*, *Reviews and collaboration*, and the same *Edit visual* and *Logo* panels as infographics. There's no *Regenerate*: to try another layout, start a new framework from the same material. If a framework couldn't be made, its page offers *Create another framework*.

A framework in the framework viewer.

Building a decision page

A decision page lays out options, criteria and trade-offs as one review-ready visual. AI writes it from your material and Prism draws it. Since 1 October 2026 decision pages are a Gixo Prism artifact, like frameworks, and every Prism plan includes them. Inside a Gixo Business report, the options, criteria and decision table stay in the report itself.

[Create Decision Page](https://gixo.ai/decisions/create) gixo.ai/decisions/create →

1 What is it about?

Answer *What decision needs to be made?* as a question, up to 200 characters. Add the options, criteria and constraints with **Add a file or existing content:** *Upload files* (up to 10), *Paste text*, *From your library* or a *Saved source set*.

2 Pick a layout

Eight layouts: Decision Matrix, Options Comparison, Weighted Scorecard, Risk-Impact Grid, Go/No-Go, Scenario Table, Trade-off Matrix and Recommendation Summary. Every decision page is made as a wide 16:9 image.

3 Make it

Click **Generate Decision**. It uses plan capacity, and the decision page opens straight away and shows it when it's ready, so you can leave.

A decision page is an image with retained source fields. During generation, supported weighted layouts calculate totals and rankings from supplied scores and weights; formal methods can withhold a ranking when inputs are incomplete. Inspect assumptions, evidence and sensitivity where available. A completeness badge is a structural check, and method confidence is not a calibrated probability of success. Nothing on the finished image recalculates its numbers. To switch layouts or rework the analysis, start a new decision page and reuse your sources: on the dashboard, the *Framework or decision* tile links to *Decision page instead*. Dashboard cards have no Regenerate. On a page you own, **Edit visual** changes the words on the image and **Logo** places your logo in one corner; neither recalculates the numbers. The viewer also has *Download*, *Share*, *Version history* and *Reviews and collaboration*. Decision pages made in Gixo Business before 1 October 2026 stay viewable and editable by their owners.

The Chart, Diagram, Flowchart and Card makers

The four makers render accepted structured inputs without an image model. Chart choice, units, visible rounding and label fit still need review. Anyone can use them without an account, and signed in, the dashboard opens the same makers inside the app. Each maker starts with picture tiles for its shapes. To see how one works, open **Start from an example** under *More*, which fills in the form without making anything.

MAKER	WHAT YOU GIVE IT
Chart Maker gixo.ai/tools/chart-maker	A table: paste CSV, where the first column is the category and the rest are numbers, or upload CSV, TSV or Excel. Pick the chart type from the picture tiles; until you do, it's a grouped bar chart. There are 22 supported chart types: bar, horizontal bar, stacked bar, line, area, pie, donut, scatter, radar, waterfall, funnel, Gantt, bar + line combo, heatmap, treemap, symbol map, marimekko, bubble, sankey, bullet, slope and dumbbell.

MAKER	WHAT YOU GIVE IT
Diagram Maker gixo.ai/tools/diagram-maker	One row per item, or <i>Paste a list</i> with one item per line. Diagram shapes include process steps, cycle, pyramid, funnel, tree, pillars, 2×2 matrix, Venn, concentric rings, layered stack, timeline, vertical timeline, org chart, mind map, or a network with the connections you define.
Flowchart Maker gixo.ai/tools/flowchart-maker	Step, decision and outcome rows, up to 200, drawn as a decision flow or as a swimlane across the people or teams involved.
Card Maker gixo.ai/tools/card-maker	A big number, quote, callout, definition or comparison table.

Makers inside the app

Signed in, *Chart*, *Diagram or flow*, *Flowchart instead* and *Card* on the dashboard open the makers inside Prism, at gixo.ai/prism/new/chart and the matching addresses for diagrams, flowcharts and cards. There, making the visual also saves it to Your work and opens it in its editor. If the save can't be confirmed, the visual stays on screen with **Save to Prism** to try again.

Chart Maker in detail

- **Chart controls and limits.** Under *More*, review category order, category/series limits, number format, visible precision, legend, data labels and grid lines. Standard mode allows up to 60 categories and 8 series; expanded mode allows up to 120 categories and 32 series for compatible charts. Defaults vary by chart. Combo charts can use an independent secondary axis, whose scale and unit need separate review. Warnings identify discarded or limited input; visible data labels use 0-2 decimal places and long labels can be shortened.
- **Uploads.** The public Chart Maker accepts text tables up to 2 MB and Excel workbooks up to 5 MB. Its Excel importer reads the first worksheet, bounded to 500 rows, 30 columns and 100,000 converted CSV characters; formulas and macros are not run. For discovered source tables, column selection and category joins across files, use the separate Document to Visual/source-composition workflow and review missing matches before accepting a projection. A symbol map needs Location, Latitude, Longitude and Value columns, because Prism doesn't look places up.
- **Colours.** *Theme* offers two looks, Conservative and Bold, and Bold is the default. With a saved Brand Kit they're named Brand conservative and Brand bold and take your kit's colours. Or open *Brand colors* under *More* and enter your own.
- **Checking the figures.** Paste the passage the numbers came from into *Authoritative source text*, under *More*. Prism compares supported visible numeric claims with numbers found in the supplied text and lists the values it can't find there. A matched value does not establish its period, unit, meaning or factual correctness; check those yourself.
- **After you click Make chart.** Change the content in the editor and click *Apply changes* (*Save changes* once the chart is saved), or open *Advanced canvas editing* to drag, align, group, layer or hide objects.

- **A data table for screen readers.** A new chart carries a collapsed *View chart data* table with its exact values. HTML files, embeds and share pages keep it; PNG, PDF and PowerPoint files leave it out. To drop it, clear *Include accessible data table* on the editor's *Check* tab.

The screenshot shows the Gixio Chart Maker interface. At the top, there are three dropdown menus: 'Chart type' set to 'Bar', 'Title (optional)' set to 'Fictional quarterly reporting review', and 'Brand treatment' set to 'Brand conservative'. Below these are two text input fields: 'X axis title (optional)' and 'Y axis title (optional)' set to 'Thousand USD (fictional)'. A 'Chart controls and limits' dropdown is also present. A section titled 'Start from an example' includes a link to 'Upload CSV, TSV, or Excel' and a note 'or paste your data below'. The 'Chart data' section shows a table with 4 columns and 2 series. The data is as follows:

Quarter	Plan_kUSD	Actual_kUSD
Q1	120	116
Q2	140	135
Q3	160	148
Q4	180	169

Below the table, a note states: 'The first column is the category and the rest are numbers. Comma, tab, semicolon and pipe delimiters are detected.' At the bottom, there is a 'Brand colors' section with a dropdown for 'Verify visible numbers against source text (optional)'. A checkbox 'First row is a header' is checked. At the bottom right, there are buttons for 'Make chart' and 'Clear'.

Actual Chart Maker inputs, with fictional quarterly plan/actual values. Captured 11 October 2026; no AI generation or saved artifact.

gixo.ai/tools/chart-maker

Review and edit the result

After rendering, compare the chart with its accepted table and source text. Apply structured edits, then inspect the result again. Advanced canvas controls move and style supported maker objects; they do not recalculate an external spreadsheet or independently validate facts. Accessibility checks cover supported contrast and object issues, not complete accessibility certification.

Explicit graph relationships

Choose the **Network** shape, give nodes stable keys and connect their From/To keys. Add a relationship meaning, direction, confidence and decision-critical flag where useful. These are your annotations: neither a confidence tag nor a connector verifies a causal claim. Inspect the rendered graph and label fit before export.

Compose this design

Same numbers, laid out as a finished visual. Takes about a minute.

Compose

Earlier image-design entry on an owned maker, unsubmitted. It does not prove the newer code-rendered chart Designed controls or a provider result.

Taking a visual with you

WHO	WHAT YOU CAN DO
Anyone, no account	Make and preview any visual. Copy or download it as HTML or SVG, with a small linked “Made with Gixo Prism” credit.
A Prism trial or plan	An active Prism trial or plan enables clean unsaved HTML/SVG and supported PNG, PDF and PowerPoint export. New saved maker work has applicable Prism or Lumen access. Owners can download existing saved maker revisions without a current plan; owning an artifact does not grant new creation or AI actions.

Individual deterministic maker PowerPoint exports depend on the visual type. Compositions and AI images have different export/editability boundaries. Bar, horizontal bar, stacked bar, line, area, pie, donut, scatter, radar and bar-and-line combo charts arrive as native PowerPoint charts: their numbers sit in an embedded workbook, so **Chart Design > Edit Data** opens them, and you restyle them like any PowerPoint chart. Waterfall, funnel, Gantt, heatmap, treemap and symbol map charts, and diagrams, flowcharts and cards, arrive as native, selectable shapes and text, so you can change labels and colours in PowerPoint. So does a chart PowerPoint cannot draw the way Prism does, such as a pie with a negative slice or an area chart with a missing value. A visual with a logo keeps its native PowerPoint content, with the logo embedded as a separate picture. If the logo cannot be loaded, Prism warns you and exports the editable visual without it.

For a chart, the **Designed** controls redraw accepted values using code. Eligible signed-in users can preview styles, size, highlights, headline, subtitle, source and labels without reserving generation capacity. **Create designed image** remains a paid capacity operation and rasterizes the SVG to an image without an image-model call. Review the accepted data, units and visible plot. In a saved visual, the designed looks sit at the top of the *Style* tab, and a look you choose is the first line of its Download menu, *Designed image (PNG)*. AI-designed diagram, flowchart and card images remain a separate path; their generated wording, values and layout need inspection.

Saved visuals

Saved charts, diagrams, flowcharts, cards and combined visuals live in Your work, under **Charts and diagrams**; the old visual library address opens that view. To bring in work from elsewhere, choose **Open a Mermaid or Prism file**: in **Bring in a file**, a Mermaid diagram (.mmd or .mermaid, up to 64 KB) or a Prism file (.prism.json, up to 256 KB) becomes a saved visual you can edit. *Combine visuals* starts a new composition.

Charts and diagrams gixo.ai/dashboard/prism?view=charts →

Each saved visual opens in its own editor, with ← *Your work*, its name and whether your changes are saved across the top:

- **Download ▼**. PNG image, SVG image, PDF, PowerPoint and Web page (HTML), plus Data (CSV) for a chart, a Backup file (JSON) you can bring in again, a Mermaid diagram for a flowchart or a network diagram, and *Copy HTML*.

- **Share.** Get a *public link*, then *Copy link* or *Copy embed code* for a web page, and *Preview embed*. The public page shows the visual only: not your source text, edit settings, name or history. *Invite reviewers* creates guest review links that expire after 1 to 30 days and that you can revoke; each link is shown once, so copy it straight away. You can also let signed-in people without a Prism plan review the link. When the link shows an earlier revision, *Republish this version* updates it, and *Revoke* turns it off. Only the visual's owner can publish, revoke or invite reviewers.
- **⋮ More actions.** Start a new visual of the same kind, *Save as template*, *Arrange parts* to drag and arrange the parts on a canvas, *Live data* for a chart, *Live data and batches*, and, for the owner, *Move to Trash*.
- **Edit, Style, Check and History.** The tabs beside the preview hold the fields, the theme and looks, the checks before sharing with the accessibility settings, and the versions, comments and reviews.
- **Ask Prism to change something.** At the top of the Edit tab, a chip asks straight away: *Shorter labels*, *Board-ready wording*, *Better chart type* for a chart, or *Write alt text*. Or say what to change in your own words and click **Ask Prism**. Prism rewrites words, and for a chart can suggest a better chart type; it never changes your numbers. Compare the before and after, tick the changes you want, and *Use this* puts them in your draft, which *Save* keeps as a new revision. It uses the AI assists included with your plan.
- **Keep this chart up to date.** Under a chart's fields, link it to a published Google Sheet, a CSV file, an Excel workbook shared publicly or JSON data, and choose how often to *Check for new numbers*, from *Only when I ask* to *Daily*. The connection reads a public, credential-free source under supported fetch limits. *Change the data first* keeps only some rows, sorts them, picks columns or adds one calculated column. New numbers wait for you to accept them, and acceptance creates a new revision; until then the chart keeps the numbers it has. *Check for new numbers now* and *Disconnect* sit beside it. Check scheduling admission and status instead of assuming a timer updated a publication.
- **Save as a reusable template.** Retains supported structure, style and object layout. Map later CSV input only to allowed fields; connections, source controls and brand locks remain protected.
- **Comments and versions.** On the History tab, comment, reply, mention someone with @name and resolve. *Restore* makes an earlier version current, and the current one stays in the list.

On a team, the Member role can view and comment on the team's visuals but not change them, and what a Member makes is saved to their own library. Ask a team admin for the Editor role to change team visuals.

Actual saved wording-refinement controls with an entered instruction, unsubmitted. No AI suggestion or provider result.

Compositions

Combine visuals, on the dashboard, opens **New composition**, which puts 2 to 12 saved charts, diagrams, flowcharts or cards on one page. Choose a layout: *Editorial* (one visual per row), *Grid*, *Dashboard* or *Story*. Then add an introduction and alternative text. Prism pins each selected child revision. Editing a child does not automatically change the composition. Review a source-update candidate, accept or cancel it, then deliberately choose whether to update the composition and republish. Composition editing can change sections, layout and supported object placement without turning every child into independent native PowerPoint data. gixo.ai/prism/compositions/new

Live data and batches

Once you have a saved chart, **Live data and batches** appears under *More* on the dashboard; every saved visual's ⋮ menu links to it too. It has three tabs. **Your charts** lists your charts, each with *Connect data* or *Refresh now*, and *Make a template*. **Templates** holds reusable structures made from any saved chart, diagram, flowchart or card; a template keeps structure, styling, accessibility settings and layout, not the source text, data connections or AI conversation. **Batches** maps CSV columns to a template's text fields and makes up to 50 code-rendered visuals at a time. Review mappings and every output; the template's layout, data connections and locked brand settings are not batch input. This is a visual reporting workflow, not a private database connector or unrestricted BI model. gixo.ai/prism/data-workspace

Actual owned reusable template and allowed CSV-field controls. The batch was not submitted; arbitrary numeric/source/brand replacement is not demonstrated.

Selected calculation metrics and next-period charts

Export a reviewed Business calculation metric pack and select it in the maker's metric-recipe panel. Explicitly map metrics to chart cells, confirm expected units and choose raw or displayed values. Review the selected-cell calculation receipts. Only those selected values travel; Prism does not synchronize a whole workbook or independently verify the assumptions.

For a variance chart, Actual and Budget series compare same-period levels. A signed Actual-minus-plan amount answers a different question; a percentage needs the intended plan-baseline formula and a nonzero denominator. Use a compatible bar or line chart for negative values and keep currency and percentages in separate shared-axis metric charts. For a later period, upload a new pack and period label, store a candidate, review changes, then accept or cancel. Publication and composition revision selection remain separate actions.

Budget leads in Revenue at 100,000.

✓ All 2 visible numeric claims matched the attached source.

Made with **Gixo Prism** — exact, on-brand visuals from your data. Want the AI to build visuals from a description, apply your brand kit, and make a Campaign kit for every channel? [See Prism →](#)

Actual period-two Budget 100000/Actual 92000 chart accepted as saved revision 5. Fictional generic currency assumptions and output still require review.

Document to Visual

This turns a document into an editable chart, diagram, flowchart or text card. It doesn't make infographics. Under **Add a file**, choose up to 5 files, 5 MB each: PDF, Word, PowerPoint, Excel, CSV, TSV, Markdown or text; add a spreadsheet beside a report and Prism can chart figures from both. Under **What should it become?**, pick *Let Prism choose*, *Chart*, *Diagram*, *Flowchart* or *Card*, and under *More options* say what it should emphasize, in up to 1,000 characters. **Prepare visual draft** needs a trial or plan and uses one AI assist, counted only once your files have been read into text, and given back if no draft comes of it. Review the proposal, selected tables, category mapping, unit assumptions and any missing source matches before accepting it. A figure Prism can't find in your files comes back with a note in the draft instead of stopping it, so check every flagged value. The proposal distinguishes selected source values from AI-authored structure. Numeric matching does not establish context or source correctness. Adjust the draft, click *Update preview*, then **Save visual and open editor**.

Document to Visual gixo.ai/prism/from-document →

Campaign kits

A campaign kit turns one message into everything you need to post it: one picture with your headline laid over it, cut to the exact size of each place it will go, a caption and alt text for each channel, and one download. Prism doesn't post for you. You download the kit, or export a CSV for a scheduler, and post it yourself.

Make a campaign kit gixo.ai/dashboard/prism/campaign-kit/new →

Start one from **New visual** or the dashboard's **Campaign kit** tile. From a document, *Create from this* › *Campaign kit* opens the same page with that document chosen. The page asks three questions; a new kit starts with the places and design of your last kit, and *Use the standard set* goes back to the usual ones.

1. What are you promoting?

Describe it

An event, launch or offer, described in a sentence or two. It's chosen when the page opens. Until you write your own headline, your first sentence fills it. Prism makes one picture for it.

AI PICTURE

My photos

Up to 10 of your own photos, PNG, JPEG or WebP, 10 MB each, and a line on what they're for if you like. The first is the main photo, the picture every channel is cut from. You can switch to another of them on the kit.

NO IMAGE GENERATION

A document

Pick something you wrote or imported, from a searchable list of your documents; opened from a document, this reads *This document*. Its title becomes the headline and its first sentence the supporting line, until you change them. Prism makes one picture for it.

AI PICTURE

2. Where will it go?

Click a channel to add or remove it. The channels come in three groups, *Social posts*, *Web and email* and *More places*. Each one shows the shape and size its picture is cut to, and the cut keeps the subject of the picture in frame. Instagram post, Instagram Story, LinkedIn post and X are the standard set.

CHANNEL	PICTURE (PIXELS)	CAPTION
Instagram post	1080 × 1350 (4:5)	Up to 2,200 characters, with about the first 125 showing before “more”, and up to five hashtags
Instagram Story	1080 × 1920	None: the words are on the picture
LinkedIn post	1200 × 627	Up to 3,000 characters, with about the first 140 showing before “see more”
X	1536 × 864	Up to 280 characters
Carousel	5-10 slides at 4:5	One post caption; separate alt text for each slide
TikTok cover	1080 × 1920	Up to 4,000 characters, with about the first 100 showing before “more”
YouTube thumbnail	1536 × 864	Up to 5,000 characters
Website banner, Section background	1536 × 1024	None
Email header	2048 × 1024	None
Banner ad	728 × 90	None

3. Your message

Write a **Headline on the picture** of up to 92 characters and, if you like, a **Supporting line** of up to 170. These words go on every picture. Under each one, a counter shows its length against what fits comfortably on each channel you chose. Long copy can reduce the text size or exceed a channel's intended budget. Once there's a headline, a *Layout preview* shows it on your channels; inspect it and shorten the line when needed. *Write the words for me* fills the headline and supporting line from what you described, or from the document, and offers *Undo*; it uses your plan. *Captions in* sets the captions' language: the language of your words, unless you choose another.

Design

One design goes on every channel. A new kit uses Clean Brand, or your last kit's design, and you choose another on the kit at no cost. The designs take the colours and fonts of your Brand Kit if you have one; the page says whether your Brand Kit is applied.

DESIGN	WHAT IT LOOKS LIKE
Clean Brand	A calm layout that lets your picture and brand lead. It's the standard design.
Editorial	A serif headline with a fine brand rule, set like a magazine cover. In <i>Edit picture</i> it also takes a short kicker line.
Bold Announcement	Large type on a solid band in your brand colour, for launches, offers and news.
Product Spotlight	Your picture first, with the message on a brand-colour bar in the lower third.
Corporate Proof	A brand-colour panel beside your picture, for results, evidence and outcomes.
Quote	A type-led quotation with brand framing, set on a plain card without the picture.
Key Stat	One important number set large with short context, on a plain card without the picture.

Click **Make my kit**. The kit is saved and opens straight away. For a kit you describe or one made from a document, making the picture, captions and alt text uses plan capacity. Your own photos are used as they are, so in a photo kit only writing the captions and alt text does. Cutting the picture to each channel and changing the design use none.

Your kit

The kit shows its progress in three steps, *Picture*, *Captions* and *Channel pictures*, with a count of the channels that are ready. Each channel's card fills in as its picture comes back. The kit is saved as it goes, so you can leave and come back. If a step didn't finish, the kit offers a button to run it, such as *Pick up where it stopped*, *Make the picture* or *Write the captions*, rather than spending plan capacity by itself. When everything is done it says *Your kit is ready*. Changes that produce new campaign output require active Prism access; an owner whose plan ended can still open and download a kit.

- **Download all (ZIP)** sits above the channels, with *Just the scheduler spreadsheet (CSV)* beside it. The ZIP holds a folder for each channel with its picture as a JPG, its caption and its alt text; a *carousel* folder with the slides in order, the post's caption, each slide's alt text and *carousel.pdf*; *vector-message-cards*, editable SVG cards of your headline and supporting line in landscape, square, story and banner sizes, which are separate text designs from your channel pictures; and *campaign.csv* and a README with posting steps. The CSV gives one row per channel, with the file, size, caption, alt text and hashtags, for a scheduling tool that takes a bulk-upload spreadsheet. Neither download uses plan capacity.
- **Each channel's card** shows the picture at that channel's shape, its caption and its alt text. The kit writes three caption options for each channel that takes a caption. *Try another* moves to the next, *Edit caption* lets you write your own against a counter of the platform's limit, and *Copy caption* copies it ready to paste. Alt text describes the picture for people who use screen readers; *Edit alt text* changes it. Until the captions are written, each channel's alt text holds the words printed on its picture.
- **Download picture** on a card saves that channel's picture as a JPG, and *Other formats* offers PNG and WebP.
- **Edit picture** opens that channel's picture in the image editor, described below. A picture you change there is marked *Edited by you*, and kit-wide design and word changes skip it.
- **Carousel.** Choose 5-10 slides for an Instagram carousel or LinkedIn document post: the cover, one point per slide, then a closing slide. When your source gives fewer points, the carousel has fewer slides, and nothing is made up to fill one. Changing the number of slides is free. Each slide has its own *Edit picture*, and the card has *Download slides* and *Download PDF*. Review every slide, its order and alt text. The kit uses one post caption; it does not publish the post for you.
- **Write new captions** writes new caption options for every channel. Alt text you wrote stays as it is, and so do captions you edited, unless you tick *Replace captions I edited too*. It uses plan capacity, asks first, and *Undo new captions* brings the earlier ones back.
- **Change the words, design or picture** opens the kit's tools. *Your message* changes the headline and supporting line on every picture, except those you edited on their own. *Design* redraws every channel you haven't edited on its own in another of the seven designs. In a kit made from several photos, *Main photo* chooses the one every place is cut from. None of these uses plan capacity. *Make a different picture*, for a kit described in words or made from a document, makes a new picture and cuts every channel from it again, including any you edited; the earlier pictures stay in each channel's versions. It uses plan capacity and asks first.
- **How to post**, at the foot of the kit, gives the steps for Instagram, LinkedIn, X and a carousel, including where each takes the alt text, and for using the CSV with a scheduler.
- Rename a kit in its *Kit name* box. *More › Delete kit* removes the kit and its channel pictures from your library.

READ THE CAPTIONS BEFORE YOU POST

AI writes the captions from your headline and your source, in the language set under *Captions in* and inside each platform's limit, and it's told not to invent numbers, results or quotes. Check names and facts anyway, and look over an AI picture before you use it.

Finding your kits

Use the **Campaign kits** filter in the dashboard's *Your work* grid; the old campaign kit library address opens it. Dashboard cards show each kit's status, *Ready*, *Not finished* or *Needs another try*, and its edit date. A kit made from a document links to *Other kits from this document*, a list of that document's kits. A Social Pack made before campaign kits is listed with them, labelled *Older kit*: you can open it, copy its captions and download it, and to change anything you make a new kit.

Campaign kits gixo.ai/dashboard/prism?view=kits →

A document's images

On the dashboard, *Older single pictures* lists the single images you made before campaign kits. Each opens its document's images page, *Images for* followed by the document's name, which also holds the pictures of that document's kits, each labelled with its kit and channel. The page leads with **Make a campaign kit** and a link to the document's kits. New pictures are made as campaign kits, not on this page. On each image:

- **Full Preview** and **Edit picture**.
- **Use my own image** makes a picture of yours the current image. The one it replaces stays as an earlier version.
- **Animate (free)** makes a six-second MP4 clip of the image. The link lasts six hours and the clip isn't saved, so download it straight away.
- **Download** as WebP, PNG or JPG, and **Copy** the image link, HTML or Markdown. Copied links are public: anyone who has one can see the image.
- **Delete** removes the image and all its saved versions.

Edit picture

Edit picture, on a kit's channel card or carousel slide, or on a document's images page, opens one picture with a live preview drawn by the same renderer that saves it. Prism lays the words and logo over the picture rather than asking AI to paint them, and editing uses no plan capacity.

- **Choose a design**. The seven designs, each shown over your picture at this channel's size.
- **Use a real photograph**. Search freely licensed photographs by subject, such as a place's proper name, and use one instead of the picture. Any credit the licence asks for is kept with the image. Each search uses one of the AI assists included with your Prism trial or plan.

- **Finish.** Natural, Crisp, Warm, Cinematic or Brand Monochrome grades the picture and leaves the design as it is. Quote and Key Stat have no finish.
- **Headline and supporting line.** A counter shows the headline's length against what suits this format. Long lines may be reduced to fit supported templates; review the actual size and export readability. Editorial also takes a kicker, a short optional line you can clear to remove.
- **Logo.** On the website banner, section background, email header and banner ad formats, upload a logo and put it in any corner. The social formats, carousel slides, YouTube thumbnails and TikTok covers take no corner logo.
- **Versions.** Each *Save picture* is a new version. Compare versions, look at the original, or make an earlier version the current image. The original is always kept, and undo and redo work while you edit.

Prism inside your other Gixo products

- **In the editor.** In a Quill article, an Arc proposal, a Folio chapter or a Lex document, select text, open ⋮ (More formatting) in the toolbar and choose **Insert chart or diagram**. In Lex, **Insert diagram** is also in the document's *More document actions* menu. Choose a diagram, flowchart, text card or chart, describe it (for a chart, paste CSV or TSV data), then insert the result. Each visual uses one of the AI assists included with that product's plan, so you don't need Prism for this.
- **In Lumen.** The slide editor has **Add a Prism visual (diagram, chart or card)**, and **Insert a saved visual** to bring in one of your saved Prism visuals.
- **From a document.** Under *Create from this*, *Infographic*, *Campaign kit*, *Framework* and *Decision* open the matching Prism page with the document already loaded. These need Prism, whichever product the document belongs to, and a campaign kit uses your Prism plan capacity. Without Prism, the menu shows them with "with Gixo Prism" after the name, and they open the Prism product page.

What needs a plan

ACTION	WHAT IT TAKES
Making and previewing charts, diagrams, flowcharts and cards	Nothing. No account needed.
Maker HTML and SVG with the Prism credit	Nothing.
Clean unsaved maker files, new saved work, publishing, batches and campaign operations	Applicable active access. Maker and other deterministic operations do not use AI generation capacity. Existing saved maker owners can download their revisions without renewing.
Infographics, frameworks, decision pages, a campaign kit's AI picture and its captions and alt text, chart Designed images and nonchart AI-designed images	An active trial or plan. Uses plan capacity.

ACTION	WHAT IT TAKES
Ask Prism, Document to Visual, real- photograph search in Edit picture	An active trial or plan. Uses the AI assists included with it.
Brand Kit: saved brand colours and logo	Professional and up. Manual colours are separate controls in supported makers and infographic/framework workflows. They change the individual visual, not the saved kit. Campaign Kit currently uses saved-kit styling without its own colour picker.

Plans and your trial

Each Prism plan has one price, in US dollars, and includes a set number of seats. Every plan includes capacity that resets each month, and your subscriptions page shows a usage bar rather than counts.

PLAN	MONTHLY	ANNUAL	SEATS INCLUDED
Starter	\$10	\$90	1
Professional	\$25	\$250	2
Business	\$45	\$450	5
Enterprise	\$99	\$999	10, by private offer

- **Every plan** includes infographics, frameworks, decision pages, campaign kits, clean maker files, saved visuals, publishing and Ask Prism. Higher plans add capacity and seats.
- **Sharing with named people** and **Brand Kit** start at Professional.
- **The 14-day trial** needs no card, and each email address gets one Prism trial. It works like Starter, with half of Starter's monthly capacity. When it ends, making and editing visuals and clean maker files pause until you choose a plan.

Start a 14-day Prism trial gixo.ai/start-trial →

Prism plans gixo.ai/products/visuals#plans →

Prism plans on the public pricing page. gixo.ai/products/visuals#plans

Free tools, no account needed

Besides the four makers, these tools run without a sign-in and without AI.

TOOL	WHAT IT DOES
Chart Palette Contrast Checker gixo.ai/tools/chart-contrast-checker	Checks each series colour against the chart background and its neighbours using WCAG contrast ratios, and suggests fixes that keep the hue where possible.
Chart Data Integrity Checker gixo.ai/tools/chart-number-checker	Checks CSV row widths, numeric cells, missing values, duplicate labels and percentage totals under its fixed rules. It does not verify the source or business meaning.
Chart Honesty Checker gixo.ai/tools/chart-honesty-checker	Reads five fixed text signals: baseline, perspective, percentages, source and unit mentions. It does not inspect a rendered chart or prove that its scale, units or category order are honest.
Waterfall Chart Maker gixo.ai/tools/waterfall-chart-builder	Checks that a starting value, its gains and losses, and the ending value add up before drawing the bridge.
Gantt Chart & Timeline Maker gixo.ai/tools/gantt-chart-builder	Turns tasks and dependencies into a Gantt chart with working-day dates and float.
Mermaid Flowchart Maker gixo.ai/tools/mermaid-converter	Converts a supported Mermaid flowchart subset to SVG. Unsupported syntax needs review; this is not arbitrary Mermaid, UML or BPMN support.
RACI Matrix Validator gixo.ai/tools/raci-matrix-builder	Checks that each task has one accountable owner, and flags missing or overloaded responsibilities.

Print design availability

Prism's print workflow has format-specific fields, layout choices, preflight and print PDF, trim PDF or PNG export where enabled. The available formats depend on configuration and account access; a format listed in the code is not a promise that it is publicly launched. If Print designs is available in your account, check the offered format, dimensions, content-fit and preflight findings before export. Software preflight is not printer certification, universal font fidelity or CMYK proof. Ask your printer to confirm the production requirements.

Edit, check and export a manual design

For enabled formats, designed layout previews help select presentation and eligible **Solid/Light** alternatives change its tone. New designs start on a newer style: a soft palette, cards and fine rules. A design saved before it says *This design uses the original style* and keeps it until you choose **Use the new**

style. That creates a new revision while retaining authored words/layout and custom or saved-kit colours; the earlier look remains in saved revisions. Review the changed preview and preflight before export. This is not a quantified ink-saving or printer-certification promise.

Choose an enabled format and layout, enter your own required fields and continue to the saved editor. The editor groups *Design settings* (name, size and purpose), *Content*, *Layout*, *Photos* where the format takes them, and *Brand & style*:

- ✨ **Suggest** sits under each wording field. It drafts wording for that one field, shown under it for you to *Apply suggestion* or *Discard suggestion*; your facts and item prices stay yours. It uses your plan.
- **Try a coordinated style**, in Brand & style, changes the palette and fonts together and leaves your words, photos and logo in place. You can also set each colour, the heading and body fonts and a logo yourself, or *Use my saved Brand Kit*.
- **Download** sits in the header beside the design's name. *Download PDF* is the trim-size file, ready for printing in the office; *Other formats* has a *PDF for a print shop (with trim margin)* and a *Picture (PNG)* of the side shown in the preview. Every download runs the print checks on your saved design first, and what a check or download reports is said under the button.
- **Print checks** can also be run with *Check before export*. Each failed check has a *Fix* link that takes you to the setting to change.
- A **Make this design** panel, which fills empty wording and adds an abstract background from a brief and up to six PDF, Word, text or CSV files of 5 MB each, appears only when AI drafting for Print is switched on. It is off by default.

Review the preview and any content-fit findings, then download and inspect the actual file. In the captured local example, a manual fictional A4 flyer passed the software checks and produced the two files linked below; this does not establish every format or a production launch.

Actual saved fictional flyer with text, layout and owned-revision preview. No AI generation.

Actual software checks on the saved fictional flyer, followed by actual A4 trim PDF and PNG exports. This is not printer certification or CMYK proof.

Inspect the actual sample [A4 trim PDF](#) and [PNG](#).

Tips

- **Use a maker for a structured chart or diagram**, and compare its accepted inputs and actual display. Use an AI infographic for composed narrative imagery and review the generated words and figures.
- **Try layouts freely**. Picking a shape, layout and style, and the Suggested layout, use no plan capacity, so try a few before you generate.
- **Review regenerated work**. Regeneration and AI actions have their current access and plan-capacity rules; compare the new image with its sources before publishing.
- **Inspect the selected source table**. Confirm the sheet, columns and category matches before accepting a chart projection.

- **Already have the picture? Start the kit from your photos.** They're used as they are, so only the captions and alt text use plan capacity.
- **Settle the design before you edit single channels.** A new design for the kit leaves a picture you edited on its own as it is.
- **Download animations straight away.** An animation link lasts six hours.
